## Hydrodynamic design

The operation of the water meter is based on a turbine in the upper part of the water meter, which allows the passage of solid particles at the top of the water meter, which allows solid particles to pass through without clogging the meter.

obstructing the meter. There are no obstructions in the metering tube, and therefore the head losses are very low. pressure losses are very low.

## Independent mechanism

With a completely independent mechanism protected against magnetic fields, the water meter allows for easier repair, without the need to remove the water meter from the installation, greater durability and security against fraud.

## High flow rate

The system on which the Hidrotangencial water meter is based is designed to provide a high flow rate with the minimum possible loss of head.

## Technical specifications

- ✓ - Tangential propeller and removable mechanism.
- ✓ - Class A horizontal installation (note the direction of flow indicated on the body by an arrow).
- ✓ - Low pressure losses.
- ✓ - Dry sphere.
- ✓ - Magnetic transmission.
- ✓ - Direct reading on dial.
- ✓ - Protective cover.
- ✓ - Cast iron body.

## Installation diagrams

Water disrupting elements upstream from the meter. DN= Ø Water meter	Required length upstream from the meter = L	
	With flow stabilizer	Without flow stabilizer
Centrifugal pump	L=15DN	L=5DN 3DN
Gate valve fully open		
Regulating gate valve	L=10DN	L=3DN
Sieve filter	L=5DN	L=3DN
Elbow/ Tee	L=10DN	L=3DN
Reduction cones	L=5DN	L=3DN
Extension cones	L=10DN	L=3DN

The accuracy of a water meter can be affected by turbulences caused by various elements such as elbows, regulating valves, tees, etc..., therefore in these cases it is necessary to have a straight run in front of the water meter.

However, this straight run can be reduced or replaced by a flow stabiliser spool upstream of the water meter and connected to the water meter.

REV3

## Installation instructions

It is recommended to always place the water meter at a low point in the installation.

Position the water meter so that the arrow corresponds to the direction of water flow.

Do not force the water meter during installation, avoid tensile and torsion stresses.

The water meters must always be filled with water. A minimum pressure of 0.3 bar is recommended at the outlet of the water meter to ensure that it is completely filled with water. Install at a lower level with respect to the slope of the rest of the pipe, thus also eliminating the formation of air pockets inside it.

If air is present in the pipe, it is necessary to place release valves to avoid erroneous readings.

If the water in the pipe has coarse particles in suspension, it is recommended to install a roughing filter beforehand.

Provide a shut-off valve upstream of the water meter to facilitate its maintenance and/or repair.

Before installing a water meter in a new pipe, it is recommended to drain it to eliminate particles.

The inner diameter of the pipe must be equal to the nominal diameter of the water meter.

## Pulse output

### PULSE OUTPUT REED BULB

Pulse value	DN: 50-125: 1 pulse 100L DN 150-300: 1 pulse 1000L
Minimum current for contact closure	0mA
Maximum current for contact closure	100mA
Contact closed resistance	< 1 Ω
Contact open resistance	~ ∞
Max. withstand voltage	24V
Max. contact stabilisation time	100 us
Contact closed contact duration	40% of cycle
Standard cable length	1,5 m

## Automatic meter reading

Adding the IRIS communications module to the water meter will enable automatic remote readings. IRIS devices allow mechanical meters to access the world of IoT communications. Its great versatility allows it to be integrated with a wide range of meters.

The IRIS communications module is integrated with the Demeter system. It supports the integration of a wide range of devices using various communication technologies to suit the needs of the installation.

## Alarms

**🔔 Leakage alarm:**

Detection of continuous consumption for a maximum period of time. Configuration adjusted by communications.

**🔔 Water meter stopped alarm:**

The alarm is activated if no consumption is detected for a maximum period of time. Configuration adjusted by communications.

**🔔 Under-dimensioned water meter alarm:**

Detection of flow rate higher than the overload flow rate for a maximum period of time. Configuration adjusted by communications.

**🔔 Battery status alarm:**

Various battery alarm levels are activated depending on the remaining battery life.

REV3

## Functionality

Operating profiles based on the recording consumption and communications records requirements:

- ✓ · Normal-24: Sending data every 24 hours and recording every hour.
- Normal-8: Sending data every 8 hours and recording every hour.
- Medium: Sending data every 12 hours and recording every 30 minutes.
- Extreme: Sending data every 6 hours and recording every 15 minutes.

MODE	AUTONOMY	COMUNICACION	DATA HISTORY RECORD
Normal -24	12 years	24 h	1 h
Normal -8	TBD	8 h	1 h
Medium	TBD	12 h	30 min
Extreme	TBD	6 h	15 min

\* TBD (to be determined). 24 maximum storage and sending readings: each sending allows accumulating up to 24 values for each communication interval.

9

## **1- Has the turbine broken down?**

Turbine breakage may be caused by the presence of solid particles of considerable size, e.g. stones and pebbles that may be suspended in the water.

In this case you should replace the water meter mechanism and place either a “Y” or basket strainer upstream of the water meter to prevent this from happening again.

## **2- Does the water meter not add up?**

It is likely that it is clogged, has a faulty internal part or has suffered from age-related wear and tear. When wear due to ageing occurs, the water meter may add up m<sup>3</sup>, but not the actual m<sup>3</sup>. In this case, the faulty element must be replaced. Our water meters, thanks to their hydrodynamic design with independent mechanism, make this type of repairs very easy.
